## Foreword

The need for compilation of energy balance is linked to such important issues of global policy, as climate change and energy security. The publication includes statistical data for 2013.

Since 2013 the Geostat has set a goal to develop energy statistics in Georgia and create complete energy balance in compliance with international standards and methodology. It should be noted that the latest official energy balance was developed by the Statistics Office in 2002.

The energy balance was created due to growing interest of a wide range of users, as it represents the best tool for the local or global policy planning.

With regard to compilation of complete energy balance it is worth to mention the international cooperation and methodological support of EU program INOGATE, which largely contributed to successful implementation of this work.

New energy balance was compiled based on the recommendations of International Energy Agency and fully complies with the international standards.

The statistical publication, prepared by Business Statistics Division of the National Statistics Office, is the first official energy balance in Georgia after 2002.

The publication is based on the declared data of various surveys conducted by the National Statistics Office during 2014. Different types of administrative data as well as expert assessments have been used in order to create the energy balance.

The publication is designed for various groups of users.

National Statistics Office of Georgia

### Survey Program

In order to create complete energy balance in compliance with the international standards, from the beginning of 2014 with the assistance of experts of EU program INOGATE the Geostat developed methodology and survey questionnaires, ensuring collection of data required for the energy balance.

With the purpose of collection information needed for compilation of complete energy balance, the Geostat carried out several surveys during 2014; the surveys were conducted in two areas: in energy sector and final consumers.

In terms of data collection 20 types of questionnaires were developed, specialized by energy forms and institutional sectors. The questionnaires are presented in two groups. The first group is focused on the energy sector, and the second – on final consumers of energy forms.

In order to collect data from the energy sector, producers, suppliers, distributors and traders of energy forms (coal, natural gas, electricity and heat, oil and oil products, biofuel and waste) were surveyed at full coverage as a result of specially organized statistical surveys.

With the aim of collecting information on the consumption of the energy forms the survey was conducted in all institutional sectors: non-financial corporations, financial corporations, non-profit institutions serving households, households and public administration.

**From the sector of non-financial corporations** (business sector) the annual, regular business survey was used to collect information on the consumption of the energy forms. The special attachments on energy consumption were supplemented to this survey questionnaire.

Stratified random sampling method was used for the survey; large-sized enterprises were surveyed at full coverage, while the medium and small-sized enterprises – by random sampling method. The sample size was approximately 12500 units. After collection and processing of

relevant information from the sampled enterprises, the data were weighed to the sampling frame.

**From the sector of financial corporations** the special survey was conducted in order to collect information on the consumption of the energy forms; the survey fully covered the banks operating in the country, micro-financial organizations and insurance companies.

**For the study of the sector of non-profit institutions serving households** the regular survey of non-profit institutions was used, supplemented by special attachments on energy consumption.

Stratified random sampling method was used for the survey of this sector; The sample size was approximately 400 units. As they were surveyed, the data were weighed and the results spread to the sampling frame of organizations in the relevant sector.

**From the sector of households** the regular survey of households, conducted by the Geostat on quarterly basis, was used to collect relevant information. The questionnaire of the survey was supplemented by special attachment on energy consumption.

Two-stage stratified random sampling method was used for the survey of the households; the sample size was approximately 3400 units. After they were surveyed, the data were weighed and the results spread to the sampling frame of households.

With the purpose of collecting information on the energy consumption of **public administration** sector, state institutions were surveyed at full coverage.

The survey covered the state institutions, ministries, legal entities of public law, central, local governing and self-governing bodies, public schools, etc. The number of respondents was identified as 2500 units.

In the household sector the data were collected by face-to-face interviewing method, while in other sectors data collection was primarily carried out by means of online

questionnaire, however the respondents were able to use other alternative means (paper questionnaire, electronic questionnaire in excel format, fax, etc.).

In addition to the above-mentioned surveys in terms of compile complete energy balance, it became also necessary to retrieve, collect and process various types of administrative data. In certain cases expert assessments were carried out as well.

Processing of data obtained from the surveys, database cleaning and formation was conducted by the Geostat, while the experts of the EU program INOGATE actively participated in the analysis of data and formation of final version of the energy balance alongside the Geostat representatives.
